

# Notes and exercises from *Linear Algebra and Geometry*

John Peloquin

## Introduction

This document contains notes and exercises from [1].

## Chapter III

### Section 1

**Exercise (4).** Let  $V, W$  be a pair of supplementary subspaces of  $E$ . Every subspace  $U$  containing  $V$  is the direct sum of  $V$  with  $U \cap W$ .

*Proof.* If  $u \in U$ , then  $u = v + w$  for some  $v \in V$  and  $w \in W$ , and  $w = u - v \in U$ . So  $U = V + (U \cap W)$ , and  $V \cap U \cap W = \{0\}$ .  $\square$

### Section 2

**Exercise (1).** If  $p, q$  are the projections corresponding to a direct sum  $E = V + W$ , then  $p, q \in \text{End}(E)$  are such that  $p^2 = p$ ,  $q^2 = q$ , and  $p + q = 1$ . Conversely, if  $p \in \text{End}(E)$  is such that  $p^2 = p$ , then  $E = p(E) + p^{-1}(0)$  is a direct sum. Moreover, if  $q = 1 - p$ , then  $q^2 = q$ ,  $q(E) = p^{-1}(0)$ , and  $q^{-1}(0) = p(E)$ .

*Proof.* For the forward direction, we know  $p, q \in \text{End}(E)$  and  $p + q = 1$  (3.2.2). It follows that  $p^2 = p \circ (1 - q) = p - pq = p$  and  $q^2 = (1 - p)^2 = 1 - p = q$ .

For the converse,  $p + q = 1$ , so  $E = p(E) + q(E)$ . Also  $pq = p - p^2 = 0$ , so  $p(E) \cap q(E) = \{0\}$  and  $q(E) \subseteq p^{-1}(0)$ . If  $x \in p^{-1}(0)$ , then  $q(x) = x$ , so  $x \in q(E)$ . Hence  $q(E) = p^{-1}(0)$  and similarly  $q^{-1}(0) = p(E)$ . Finally  $q^2 = q$  as above.  $\square$

**Exercise (2).** If  $W$  and  $W'$  are both supplementary to  $V$  in  $E$ , then  $W$  and  $W'$  are isomorphic.

*Proof.* If  $p$  is the projection of  $E$  onto  $W'$ , then the restriction of  $p$  to  $W$  is an isomorphism from  $W$  to  $W'$ .  $\square$

**Exercise (3).** If  $E = V + W$  is a direct sum with inclusions  $i : V \rightarrow E$  and  $j : W \rightarrow E$ , and  $v : V \rightarrow F$  and  $w : W \rightarrow F$  are linear maps, then there is a unique linear map  $u : E \rightarrow F$  with  $u \circ i = v$  and  $u \circ j = w$ .

*Proof.* If  $p, q$  are the projections on  $V, W$  respectively, then  $u = v \circ p + w \circ q$ .  $\square$

**Exercise (11).**  $\mathbf{GA}(E)/E \cong \mathbf{GL}(E)$ .

*Proof.* Define  $\varphi : \mathbf{GA}(E) \rightarrow \mathbf{GL}(E)$  by  $\varphi(t_a \circ v) = v$ . Note that  $\varphi$  is well-defined by (3.2.17),  $\varphi$  is a homomorphism by (3.2.19), and  $\varphi$  is clearly surjective. Also  $\varphi(u) = 1$  if and only if  $u$  is a translation, so  $\ker \varphi = T(E)$ , the normal subgroup of translations. It follows that  $\mathbf{GA}(E)/T(E) \cong \mathbf{GL}(E)$ . Finally, the mapping  $a \mapsto t_a$  is an isomorphism  $E \cong T(E)$  from the additive group  $E$ .  $\square$

**Exercise (13).** If  $u : E \rightarrow F$  is affine and  $L$  is a variety in  $F$ , then  $u^{-1}(L)$  is empty or a variety in  $E$ .

*Proof.* If  $a \in u^{-1}(L)$  and  $L_0$  is the direction of  $L$ , then  $L = u(a) + L_0$  and hence  $u^{-1}(L) = a + u^{-1}(L_0)$ .  $\square$
